Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                               This clone was sequenced as part of a high-throughput process to sequence clones from Drosophila Gene Collection 1 (Rubin et al., Science 2000). The sequence has been subjected to integrity checks for sequence accuracy, presence of a polyh tail and contiguity within 100 kb in the genome. Thus we believe the sequence to reflect accuracily this particular CDNA clone. However, there are artifacts associated with the generation of CDNA clones that may priming priming from contaminating genomic DNA, retained interons due to reverse transcription of unspliced precursor RNNs, and reverse transcription of unspliced precursor RNNs, and reverse transcription about this sequence, including its location and relationship to other sequences, please visit our Web site (http://fruitfly.berkeley.edu) or send email to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        / ETAIN 1 ALL OF "MTAETLK PFITPTSANDDGFPAKATSTATAQRRTRQLIPLVLGF

Sequence submitted by:
Berkeley Drosophila Genome Project
Lawrence Berkeley National Laboratory
Berkeley, CA 94720

This clone was sequenced as part of a high-throughput process to sequence clones from Drosophila Gene Collection 1 (Rubin et al.,
Science 2000). The sequence has been subjected to integrity checks
Science 2000). The sequence of a polyA tail and contiguity
within 100 kb in the genome. Thus we believe the sequence to
reflect accuracly this particular cDNA clone, However, there are
artifacts associated with the generation of cDNA clones that may
have not been detected in our initial analyses such as internal
priming, priming from contaminating genomic DNA, retained introns
due to reverse transcription of unspliced precursor RNAS, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1455

S,

The invention describes an isolated tumour necrosis factor polypeptide (TMF). The polypeptide and polymucleotide are useful in controlling agriculturally important peers, particularly by modifying the growth, feeding and/or reproduction of crop-damaging insects or insects of farm animals. The polypeptide and polymucleotide are useful for modulating the polypeptide and polymucleotide may be useful for modulating the polypeptide and polymucleotide may be useful for treating. Thus anelorating or preventing X-linked anhidrotic (hypohidrotic) ectodermal dysplasia and X-linked anhidrotic (hypohidrotic) ectodermal dysplasia-like disorders, e.g. sparse hair, abnormal or missing teeth or sweat gland aberrations in animals (e.g. insects and potentially humans), chotoxic shock, inflammation, haemorrhagic necrosis of tumours, cyctoxicity and obesity-linked insulin resistance, all of which involve consists factor variant 2 (TNFv2) protein, described in the invention

The invention describes an isolated tumour necrosis factor polypeptide and polynucleotide are useful in controlling agriculturally important pests, particularly by modifying the growth, feeding and/or reproduction of crop-damaging insects or insects of farm animals. The polypeptide and polynucleotide are useful for modulating controlling modified and polynucleotide are useful for modulating the polypeptide and polynucleotide may be useful for treating. Thus controlling or preventing X-linked anhidrotic (hypohidrotic) ectodermal or sysplasia and X-linked anhidrotic (hypohidrotic) ectodermal or sweat like disorders, e.g. sparse hair, abnormal or missing teeth or sweat gland aberrations in animals (e.g. insects and potentially humans), condotoxicity and obesity-linked insulin resistance, all of which involve TNF molecules. This sequence encodes the drosophila melanogaster tumour necrosis factor (TNF) protein, described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GGCACCATCAGCAGCCCGAGGGGTTTATCTATATAGATGTCGCAGCTTATCATCTCATGC 420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              138

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes an isolated tumour necrosis factor polypeptide (TNF). The polypeptide and polynucleotide are useful in controlling agriculturally important peets, particularly by modifying the growth, feeding and/or reproduction of crop-damaging insects or insects of farm animals. The polypeptide and polynucleotide are useful for modulating captubalial morphogenesis, cell-matrix adhesion in files and mammals. Thus the polypeptide and polynucleotide may be useful for treating, ameliorating or preventing X-linked anhidrotic (hypohidrotic) ectodermal dysplasia and X-linked anhidrotic (hypohidrotic) ectodermal dysplasia-like disorders, e.g. sparse hair, abnormal or missing teeth or sweat gland aberrations in animals (e.g. insects and potentially humans), endotoxic shock, inflammation, haemorrhagic necrosis of tumours, cytotoxicity and obesity-linked insulin resistance, all of which involve TNF molecules. This sequence encodes the drosophila malanogaster tumour necrosis factor variant 1(TNFv1) protein, described in the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               83
                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention suesful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                             detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CTATAGCTCTGTGGATGATGTTGGCGCAGACTACGAGGACTACACCGATATGTTAAATAA

                           1.8
          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABL01840-ABL1675) and the encoded proteins (ABBS7077-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                      The sequence is that of an example randomising oligomucleotide which is used in the prepn. of mRNA encoding candidate polypeptides for the method of systematic polypeptide evolution by reverse translation (SPERT). The method provides a rapid way of isolating and identifying polypeptide ligands which bind to target mole. The polypeptide ligands can be used in e.g. assay methods, diagnostic procedures, cell sorting, as activators or inhibitors of target mol. function, as probes, as sequestering agents, drug delivery vehicles, modififers of hormone action and as catalysts. SPERT is used to select novel polypeptides that bind the antibody of the epitope commonly recognised by the antisera from autoimmune mice which are the fi progeny of a cross of NZB and NZW parents (Portanova et al., J. Immunol. 144, 4633, 1990). The known epitope consists of ca. 10 amino acids at the N-terminus of the histone HZB protein. To make mRNA encoding candidate polypeptides a 5' fixed sequence composed of a 7' promoter sequence and a ribosome binding site which is recognised by both provaryotic and eukaryotic ribosomes, terminating in a restriction prokaryotic and eukaryotic ribosomes, terminating in a restriction prokaryotic and eukaryotic ribosomes, terminating in a restriction provate stee is synthesised and cloned using a number of oligonuclectides (example shown). A 3' fixed sequence is placed into a restriction site to provide an mRNA encoding the C- terminal trailer sequence of ca. 100 nucleotides lacking stop codons. In addition, a 3' primer annealing site is provided so that cDNA synthesis can be accomplished on the mRNA recovered from partitioned ribosome complexes. See also AAQ36845-63. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                    ò
                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence was used in an example illustrating an invention relating to a method for isolating a polypeptide ligand for a desired target molecule. The method involves synthesising a nucleic acid mixture comprising mRNA having translateable and non-translatable regions and a mixture of nucleic acid.polypeptide copolymers, each comprising the mRNA and a polypeptide encoded by its associated mRNA. The copolymers are partitioned relative to their affinity to the target. The method is termed systemic polypeptide evolution by reverse translation (SPERT). The polypeptide evolution by reverse translation (SPERT). The polypeptide solution by reverse translation (SPERT). The method, diagnostic procedures, cell sorting, as inhibitors of target molecule function, as probes, as drug delivery vehicles and modifiers of hormone action and have therapeutic uses as sequestering agents. The target molecules include neutral and synthetic polymers, including proteins, hormones, receptors and cell surfaces, nucleic acids and small molecules such as drugs, metabolites, cofactors and toxins. Polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolating a polypeptide ligand to a target molecule, useful for diagnostic assays, comprises partitioning candidate mixtures comprised of ribosome complexes or mRNA.polypeptide copolymers relative to their affinity to the target molecule.
                                                                                                                  ligand isolation; systemic polypeptide evolution by reverse translation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   drugs, metabolites, cofactors and toxins. Polypeptide ted and rapidly identified by this method
                                                                                  Sequence containing a 120 repeat of ACG flanked by fixed fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3.1%; Score 66.8; DB 5; Length 390; 48.9%; Pred. The sequences given in AA172769-81 are oligonuclectides which were used to make mRNA encoding a candidate polypeptide, a 5' fixed sequence composed of a 17 promoter sequence and a ribosome binding site which is recognised by both prokaryotic and eukaryotic ribosomes, terminating in a restriction endonuclease site. The resulting nucleic acid was used in the method of the invention for preparing ligands of target molecules in which mixtures of ribosome complexes or mRNA.circle-solid.polypeptide copolymers (mRcs.pCs) are partitioned by affinity to the target and amplified to create candidate mixtures enriched in ribosome complexes or mRs.pCs with an affinity to the target, are new. The methods are termed SPERT (Systematic Polypeptide Evolution by Reverse Translation). The SPERT methods are useful for isolating polypeptide ligands for desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New methods (termed SPERT (Systematic Polypeptide Evolution by Reverse Translation)) for selecting high-affinity polypeptide ligands that specifically bind target molecules, e.g. proteins, carbohydrates, toxins,

target molecules. The polypeptide products are useful for any purpose to which a binding reaction may be put, for example in assay methods, confagnostic procedures, cell sorting, as inhibitors of target molecule function, as probes, as sequestering agents and the like. In addition, confactures include natural and synthetic polymers, including proteins, collypeptide products of the invention can have catalytic activity. Target molecules include natural and synthetic polymers, including proteins, complexite acids, and small molecules such as drugs, metabolites, cofactors, transition state analogues and toxins. The novel SPERT method involves utilizing a candidate mixture of polypeptides having a randomized amino acid sequence. Each member of the mixture is linked to an individualized mRNA, which encodes the amino acid sequence of that polypeptide in property of candidate polypeptides are partitioned according to their property of candidate polypeptides are partitioned according to their property of binding to a given desired target molecule. The partitioning is carried out in such a way that each mRNA encoding a polypeptide is partitioned exactly together with the means for further amplifying it by an in vitro process. Ultimately, both the desired optimal polypeptide are considered and further synthesis of the selected allowing further synthesis of the selected collypeptide as desired, and further synthesis of the selected collypeptide selected polypeptide (using protein chemistry) in order to produce it in a charities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              desired quantities

ADA71938 standard; DNA; 2000 BP. (first entry) Rice gene, SEQ ID 5263 20-NOV-2003 ADA71938;

Plant, bacterial infection; fungal infection, viral infection; rice, gene, ds.

involved in plant resistance or response to pathogenic infection. Mi comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to Identifying at least one gene involved in plant resistance or response to pathogenic infection for conferring resistance or tolerance to a plant to bacterial, fungal or viral infection by determining or detecting plant present invention relates to a method (M1) for identifying genes ö Hou Y; Sequence 2000 BP; 336 A; 265 C; 284 G; 363 T; 0 U; 752 Other; SA, Zhu Glazebrook J, Goff Whitham S, Xie Z, Claim 27; SEQ ID NO 5263; 899pp; English κ'n Cooper ; invention Chen W, Co WPI; 2003-175290/17 gene expression illustrate the Œ, Chang H, Katagiri

(KSHV) latency-associated nuclear antigen (LANA) gene. KSHV is also known as Human Herpes virus 8 (HHV8) and belongs to the rhadino virus, or gamma 2 herses virus class. The LANA protein is necessary for the efficient persistence of rhadino virus DNA in mammalian cells. Persistent rhadino virus infection is implicated in a variety of diseases e.g. Kaposi's Sarcona (KS). Primary Effusion Lymphoma (PBL) and multicentric Carleman's disease. In addition, KS is a common malignancy in HIV patients. KSHV persists in host cells in a latent form. One of the few genes expressed from the latent viral DNA is LANA associates with choth human chromosomes and with the rhadino virus cis-acting element (RVCAB), thereby providing a tethering function: the KSHV DNA episome is "tied" to the host chromosomes. This allows the viral DNA to persist in the latent inhibit LANA interaction with RVCAB, thereby interfering with the latency cycle of this virus. Potential antiviral treatments for the above mentioned diseases may therefore be based on LANA deregulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating or preventing a disease associated with rhodino virus infection in a mammal which includes Kaposi's Sarcoma and Primary Effusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Histone H1; tethering protein; LANA; gene therapy; multiple sclerosis;

The invention provides a composition comprising nucleic acid, histone HI forcein and expression vector operationally encoding a protein suitable for tethering the nucleic acid to the histone HI protein, where the tethering protein is LANA. The composition is useful in aiding the retention of the viral DNA in the host cell. The viral vector encodes a protein suitable for tethering DNA to Histone HI. Methods for screening for compounds which are agonistic or antagonistic for the tethering of viral proteins to histone HI and DNA binding sites are useful for developing the method of viral transfer. The composition has applications to gene therapy, including the treatment of multiple sclerosis, Parkinson's disease, Huntington disease and diabetes. The present sequence represents the nucleotide sequence of the Kaposi's sarcoma associated herpesvirus (human herpesvirus 8) latency-associated nuclear articus multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                987 ĠĠATGATĠAGGAĠĠAĠĊAĠĠAĠAĊAGATGAĠGAĠĠAĠĠAĠGATGAĊĠĀĠĠĀĠAŢĠA 1046
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CGAGGAGGATGACGAGGATGACGAGGAGGATGACGAGGATGACGAGGATGACGAGGAGGA 1166

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   an episome in mammalian cells, comprising the rhadinoviral sequence LANA (latency-associated nuclear antigen) of 3489 base pairs (see ABA93487, $1) expressed in the cell, and the rhadinoviral sequence RVCAB (rhadinoviral cis-acting element) of 801 base pairs (see ABA93488, $2) present in the plasmid. Also describes is a method for maintaining a closed circular DNA in a cell by expressing (S1) in the cells and having particularly used in gene therapy (or other gene transfer applications) that uses mammalian cells in which LANA is expressed. (A) improves persistence of gene therapy vectors in cells. The present sequence encodes Kaposi's sarcoma-associated herpesvirus (KSHV, also called human herpesvirus 8) LANA protein, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                System for episomal retention of plasmids in mammalian cells, useful in gene therapy, comprises rhadinoviral LANA and RVCAE sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a system (A) for maintaining a plasmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          828 GCATCTGGACAAGGAGCTGAAGAGCCTGAAGCGAGTCGTCGATAATCTCCAGCAGCGTTT

This sequence is a fragment of the Kaposi's sarcoma-associated herpesvirus (KSHV) LUR (long unique region). This fragment contains coding regions for ORFS which encodes capsid protein IV, ORF67, which encodes tegument protein IV, ORF68 which encodes a glycoprotein, ORF99, K12 which encodes kaposin, K13, ORF72 which encodes cyclin D, ORF73 which encodes immediate early protein (IEP), K14 which encodes (V-adh), ORF74 which encodes G-protein coupled receptor, ORF75 which encodes tegument protein/FGARAT, K15. KSHV is a new human Herpesvirus (HHV8) believed to cause Kaposi's sarcoma (KS) which is the most common form of neocuring in persons with acquired immune deficiency syndrome (AIDS). The DHFR protein is useful for vaccination, prophylaxis, diagnosis and treatment of a subject with Kaposi's sarcoma and for detecting expression of a DNA virus associated with Kaposi's sarcoma in a

This sequence represents the long unique region and terminal repeat of the Kaposi's sarcoma-associated herpes virus (KSHV). KSHV is also known as human herpes virus 8 (HHVB). This sequence contains the DNAs of the invention which encode KSHV polypeptides selected from: (a) viral invention which encode KSHV polypeptides selected from: (a) viral invention which encoded by Complement-binding protein; glycoproteins B, M or L; C (a) viral IRF ; (d) complement-binding protein; glycoproteins B, M or L; C (d) train IRF i, (d) complement-binding protein; glycoproteins B, M or L; C (d) train IRF i, (d) complement-binding protein; glycoproteins B, M or L; C (d) train IRF i, (d) complement-binding protein; glycoproteins B, M or L; C (d) capsid protein IV encoded by ORF73. Labelled probes for the nucleic acid, proteins encoded by it and antibodies (Ab) specific for the proteins are useful for c detecting HHVB, specifically for diagnosis of Kaposi's sarcoma, in body cor triplex forming molecules or agents that bind specifically to the protein. Ab may be used for prophylaxis or treatment of HHVB infection, while the protein can be used in protective vaccines. Ab may also be used for prophylaxis or treatment of HHVB infection, cother lymphoproliferative diseases such as lymphomas, leukaemia, contening the nucleic acid are useful for grang screening. HHVB-derived peptides can be cused as targets for antiviral drugs, e.g. dihydrofolate reductase gene cused as targets for antiviral drugs, e.g. dihydrofolate reductase gene the immune status of a patient infected with HVY. HVB derived protein cviral MIP III may be used as an anti-inflammatory agent for, e.g. treating rheumatoid arthritis. This sequence is stated as containing 81 containing 81 containing Frames. (Updated on 27-MUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding Kaposi's sarcoma associated herpes virus proteins – useful for, e.g. detecting levels of HHV8 in, and preparation of vaccines for treatment of, HIV patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 137507 BP; 32579 A; 37795 C; 35758 G; 31375 T; 0 U; 0 Other;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
